Overview

ABSTRACT
This study sought to develop an pilot a scalable group-based participatory intervention to improve men's health, with a focus on HIV-related mortality, through the pathways of transforming men's masculinities and strengthening livelihoods. The wider project included intervention development, and revision of the Stepping Stones manual, as well as shortening it. The specific objectives were:

1. To assess feasibility and acceptability of the intervention for young men through a rigorous process evaluation that uses quantitative and qualitative methods

2. To assess the feasibility of collecting the primary outcome - HIV testing and linkage HIV-prevention counselling around evidence-based HIV-prevention technologies (PrEP, VMMC) if HIV-negative, and uptake of HIV-treatment if HIV-positive- through the Africa Health Research Institutes electronic data collection systems in all primary health and mobile clinical services.

Main variables include recruitment into study, attendance at any session, attendance at >70% of sessions, and linkage to care.

KIND OF DATA
Survey data of trackers, recruitment into intervention, attendance at intervention, and attendance in clinical management systems.

Sampling

Sampling Procedure

We randomly selected 100 men aged 18-35 from week blocks, close to Somekele using the AHRI surveillance data. These men were approached and invited to participate in the intervention. Those who agreed were provided with information on the first session.

We also approached other men living in the same community, also aged 18-35 years, through peer navigators, who may be interested in the study.

Men who attended any intervention session, provided attendance data.
