## Overview

ABSTRACT
Thetha Nami ngithethe nawe (Let's Talk): A stepped-wedge cluster randomised controlled trial of Social Mobilisation by peer navigators into community -based sexual health and HIV care (Including Pre-Exposure prophylaxis) to reduce sexually transmissible HIV amongst youth in rural KwaZulu-Natal, South Africa.

Study aim: The overarching goal is to identify scalable and sustainable ways to stem the HIV epidemic and its negative impact on young people aged 15-30 in rural KwaZulu-Natal (KZN), South Africa through effective implementation of biosocial HIV prevention.

Specific objectives for the trial:

1. Measure the impact of social mobilisation into decentralised SRHR services that provide tailored HIV prevention on the prevalence of transmissible HIV

2. Evaluate the acceptability, practicability, and reach of social mobilisation and decentralised SRHR with tailored HIV prevention to deliver differentiated biosocial HIV prevention

3. Inform the scale-up of differentiated biosocial HIV prevention and create an infrastructure to rapidly evaluate new products

## Coverage

GEOGRAPHIC COVERAGE
Demographic surveillance area of the Africa Health Research Institute; KwaZulu-Natal, uMkhanyakude district.

UNIVERSE

About 26,000 15-30-year-old men and women residing in 40 geographical areas (clusters) of the uMkhanyakude district in rural KwaZulu Natal are eligible to receive Let's Talk intervention, of which ~20% are at risk of HIV acquisition and would benefit from PrEP. The unit of randomisation is the administrative area supported by a pair of peer navigators: 40 administrative areas will be randomised to receive the intervention, Thetha Nami ngithethe nawe (social mobilisation by peer navigators into mobile sexual and reproductive health clinics that provide tailored HIV prevention and care) or standard of care (access HIV care and prevention through primary care clinics).

The primary outcome will be collected through three random representative population-based surveys of n=2000 15-30-year-olds, 50 per cluster, at baseline, at the end of period 1 and at the end of period 2. We use the AHRI health and demographic surveillance as a sampling frame to randomly select three separate cross-sectional samples of n=3600 (90 per cluster) 15-30-year-olds stratified by gender at baseline, midpoint (before the second step of scale up) and end-line. Based on previous studies in this setting, we anticipate that ~2800 will be contactable and eligible and that n=2000 (~50 per cluster) men and women aged 15-30, will be willing and able to provide consent to be included in the study. Participants must be able and willing to give written informed consent for trial participation, or assent and parental consent in the case of those aged 15-17.

# Sampling

## Sampling Procedure

We randomly selected 2000 young people aged 15-30 stratified by age and sex in each cluster (administrative area). Then the selected participants were invited to participate in the survey.

# Data Processing

## Data Editing

Data collected by the peer navigators and clinic staff will be captured electronically on tablets using REDCap software. Automatic checks for invalid values, internal inconsistency and implausible responses will be programmed into REDCap, and additional data validation checks will be run after data collection. Data from REDCap will be uploaded to a MySQL database server within a secure server cluster at AHRI.
